Big Integer Operations

locked

Problem | Submissions | Leaderboard | Discussions

In this assignment you should implement a new data-type called Integer that can store integers with arbitrarily large number of digits. You should design such that all the standard operations that can be performed on integers will be supported as detailed below.

An integer of type Integer will have a sign and can have any number of digits in it, say 100 or even 1000. First implement the following operators on the Integer type.

Integer operator+(Integer&); //addition operation

Integer operator-(Integer&); //subtraction operation

Integer operator*(Integer&); //multiplication operation

Integer operator/(Integer&); //division operation Eg: 44/5 (=8.8) must return 8 and not 9.

Integer operator%(Integer&); //remainder operation

Integer& operator+=(Integer&); //addition and assignment

Integer& operator-=(Integer&);

Integer& operator*=(Integer&);

Integer& operator/=(Integer&);

Integer& operator%=(Integer&);

bool operator==(Integer&);

bool operator!=(Integer&);

bool operator<(Integer&);

bool operator<=(Integer&);

bool operator>(Integer&);

bool operator>=(Integer&);

friend ostream& operator<<(ostream&, Integer&);

friend istream& operator>>(istream&, Integer&);

The running time of addition and subtraction operations must be $O(d_1 + d_2)$ where d_1 and d_2 are the number of digits of the two numbers. For multiplication and division, the running time should be $O(d_1 d_2)$.

Input Format

First line contains the operation

Next two line contain the operands

End of the input contain end keyword to stop the execution

Constraints

1 <= #digits <= 60

No undefined operations like division by zero or % 0

Output Format

Print the result of each operation in separate lines

Note: All the digits must be printed. You should not use any scientific notation like e, E etc..

Sample Input 0
